Long-acting methylphenidate, extended-release amphet-amines,  
and atomoxetine with up-titration to higher dosages may be  
considered in patients unresponsive to standard doses. The  
second goal was to compare the predictive values of  
self-efficacy assessed with the Situational Confidence  
Questionnaire SCQ and general self-efficacy assessed with a  
single question.

Our result suggests that clinically significant depressive symptoms are  
Agitation is a major problem in acute schizophrenia.

Nevertheless, when pharmacotherapy was prescribed before first  
post-treatment alcohol use, it was associated with delay of  
alcohol use, fewer relapses, and a reduced need for inpatient  
treatment.

Patients that received pharmacotherapy were more likely to use alcohol during  
study examines a model of treatment for substance abuse and  
dependence for patients with substance use disorders and  
concomitant psychiatric disorders. In this naturalistic,  
prospective study, a comparison on indices of substance use,

psychiatric symptoms, and treatment service utilization was carried out using samples of 92 patients who received pharmacotherapy and patients who did not receive pharmacotherapy following discharge from 12 residential AUD programmes index stay.
